3 types of landscapes to shape the future urbanisation:

**Landscape 1**
- Existing parkland, with a mix of native and invasive species that offers a natural oasis in the urban setting.
- Pathways and seating areas integrated to enhance connectivity.
- Areas for community events and social gatherings.

**Landscape 2**
- A network of green roofs and vertical gardens to reduce urban heat and improve air quality.
- Solar panels integrated into the green roof design for renewable energy generation.
- Rainwater harvesting systems to reduce water demand.

**Landscape 3**
- High-rise buildings with green facades to provide shading and reduce energy consumption.
- Integrated parking with green roofs to maximize space utilization.
- Green corridors connecting different landscapes to enhance biodiversity.

The city of Montreuil (FR) is a prime example of how urban planning and landscape design can coexist. The integration of green spaces and infrastructural needs has led to a harmonious urban environment.

The project, named "La clé des champs: Serendipity of fields," aims to transform a former industrial site into a vibrant community hub. The concept revolves around the idea of serendipity, where unexpected opportunities and social interactions emerge from the arrangement of the spaces.

**Innovative Features:**
- A mix of green and built spaces to cater to various needs.
- Adaptive reuse of an existing building to serve multiple purposes.
- Integration of nature into the urban fabric to enhance livability.

**Challenges:**
- Balancing the need for open green spaces with the demands for commercial and residential areas.
- Overcoming the cultural resistance to change within the community.
- Addressing the infrastructure needs while preserving the natural environment.

**Implementation:**
- A phased approach to development, ensuring sustainability at every step.
- Collaboration with local stakeholders to gather feedback and ensure community involvement.
- Utilization of green technologies to minimize environmental impact.

**Expected Outcomes:**
- A model for sustainable urban development.
- Enhanced community engagement and participation.
- Improved quality of life for residents.

**Key Elements:**
- Integration of nature into the urban environment.
- Adaptive reuse of existing structures.
- Innovative planning strategies to balance needs.

**Conclusion:**
The project "La clé des champs: Serendipity of fields" exemplifies the potential for urban transformation through innovative planning and design. By embracing nature and community engagement, it sets a precedent for sustainable urban development.
